In addition to authentication ecosystems for handling simple and strong authentication. Choose from a wide range of authentication methods including public eIDs and social media, all easily available through a single integration.

Signicat MobileID App

What is the Signicat MobileID App?

The Signicat MobileID app offers a simple way to implement and use strong, two-factor authentication. This can, for example, be used for logging in to an application or adding a digital signature to a document.

When the end-user provides his or her user ID in the merchant's application, the Signicat MobileID app will automatically be started on the mobile device. Depending on the merchant's security requirements, the end-user will only have to provide a PIN or fingerprint on the mobile device to authenticate. No password is needed.

Benefits for the end-user

As the Signicat MobileID app only requires a PIN or fingerprint to authenticate, and there is no need for the end-user to provide a password, the number of login credentials to remember for the end-user will be minimal. As it will not be possible to log in without also having access to the Signicat MobileID app, the account will not be vulnerable to password theft.

The ease of authentication, combined with the reuse of authentication data for signing, provides for an excellent end-user experience.

Benefits for the merchant

A secure and simple login will also benefit merchants, as their conversions rates will increase. The two-factor authentication will increase security, as you have to authenticate with something you *have* (a mobile device) and something you *know* (a PIN). According to Gartner, as much as 20-30% of all help desk requests are due to password problems (<http://www.gartner.com/newsroom/id/1426813>). As the end-user does not need to remember any passwords in this case, the amount of help desk calls will be reduced, as well as merchant costs.

By using the Signicat MobileID App for authentication and signing of documents, the merchant is provided with low costs when it comes to both implementation and deployment. Signicat's API is simple to use, and Signicat will have full responsibility for both maintenance and implementation of new features, as well as deployment of the app to different app stores.

SIGNICAT

Signicat is one of the leading providers of electronic identity and electronic signature solutions in Europe. The company, founded in 2007, delivers online trust based services to the public and private sector globally. The solutions are used by banks and financial institutions, insurance companies, government agencies and large corporations as well as small and medium sized businesses.

Signicat specializes in cross-border cloud based electronic identity services and electronic signatures. The company has local presence in Norway, Sweden, Denmark, Finland, the Netherlands, Germany and the UK. These countries are in the forefront in the world with the usage of digital identities and electronic signatures.
