

## SIGNICAT SIGN

Signicat Sign offers flexible solutions for electronic signatures and seals. The digital communication as well as exchanging of digital documents is increasing and the need of security likewise. Signicat signature and Signicat seal ensures document origin, integrity and non-repudiation.

# Signicat Consent Signature

Signicat Consent Signature offers a simple mechanism for signing text strings.

These text strings can be used for a variety of purposes, such as committing to a payment transaction, providing confirmation that you have received a package, or giving consent to use your personal data for a given purpose in a GDPR setting.

Consent Signature contrasts with traditional contract or document signature mechanisms, as it applies specifically to small text elements. By signing consents, the end-user is bound to that specific message, which means that the signature can be used as legal evidence.

Signicat Consent Signature fills the gap between contract signing and pure text consents.

## What are the benefits for the end-user?

Signicat Consent Signature offers a smooth user experience when providing consent, especially when using browsers on mobile devices or mobile apps, making for an easy, user-friendly, and fast signing process.

## What are the benefits for the merchant?

Merchants strive to produce solutions where consent is secured and bound to actual persons. Signicat Consent Signature gives merchants the ability to securely identify the user according to EU regulations, and to prove that consent was given by the relevant person at a given time – a key component for providing compliant electronic signatures.

Signicat Consent Signature is especially preferable to more complex document sign operations in settings where consent needs to be given through an app on a mobile device. Signicat's solution makes for easy integration using OpenID Connect (OIDC) mechanisms without any web-based interaction.

Signicat offers its Consent Signature solution for eID providers, simplifying integration work. Signicat customers that already use document signing products from Signicat can utilize Consent Signature against the same providers that are already in use, as long as Signicat has enabled Consent Signature for the eID provider in question.
